Pipeline Hold Down

BKW advances pipeline hold down again by introducing the "slot weight". The slot weight replaces the concrete set-on weights and the gravel sacks. The first advance was the pull test on each auger anchor following installation that provided an engineered anchor system. This allowed pipeline hold down costs to be reduced by 75%.

For those areas not conducive to auger anchors BKW offers the slot weight. The slot weight is made of tough polyurethane and supported by nylon straps for strength. The slot weight weighs 100 lbs. and uses the backfill for weight: this lowers the cost of hold down by 50% over concrete set-on weights or sacks.

If you have a pipeline hold down problem please call BKW and we will solve it.
